

PHARMA ANALYTICS USER GUIDE DOCUMENT

PREPARED BY : V.Tharshika

TOOL : Power Bi

PROJECT : Pharma analytics dashboard

USER GUIDE OVERVIEW

PURPOSE OF USER GUIDE

The Pharma Analytics User Guide provides instructions for using the Pharmaceutical Analytics Power BI Dashboard. It explains the available report pages, navigation buttons, filters, bookmarks, drill-through, tooltips, web URLs, and security features. This guide helps users interact with the dashboard and understand the available analytical features.

REPORT ACCESS

The Pharma Analytics Dashboard is developed using Power BI and published to Power BI Service. Users can access the report through the Power BI Service workspace and interact with the available report pages and analytical features.

REPORT PAGES

The Pharma Analytics Dashboard contains multiple report pages, with each page designed for a specific analytical purpose.

Executive Sales Overview

The Executive Sales Overview page provides a high-level summary of pharmaceutical sales performance using KPI cards and visualizations. It helps users quickly understand overall sales, quantity, profit, and business performance.

Product Analysis

The Product Analysis page focuses on product-level performance. Users can analyze product sales, quantity, profit, and category-wise performance using interactive visuals, filters, and bookmarks.

Product Tooltip

The Product Tooltip page provides additional product-level information when users hover over relevant data points in the report. It displays Total Sales, Total Quantity, and Total Profit.

Product Details

The Product Details page is a drill-through page that provides detailed information about a selected product. Users can right-click a product and navigate to this page to view detailed product-level analysis.

Web URL Analysis

The Web URL Analysis page provides clickable web links associated with selected products. Users can click the URL icon to open the corresponding web page.

PAGE NAVIGATION

The dashboard provides page navigation buttons to allow users to move between different report pages easily. Navigation buttons improve the user experience by providing quick access to the required analysis page.

AVAILABLE NAVIGATION PAGES

- **Executive Sales Overview – Provides an overall summary of sales performance.**
- **Product Analysis – Provides product and category-level analysis.**
- **Product Details – Provides detailed analysis of a selected product through drill-through.**
- **Web URL Analysis – Provides clickable web links for selected products.**

HOW TO USE

Users can click the navigation buttons available in the report to move from one page to another. The selected page opens without requiring manual navigation through the Power BI page tabs.

FILTERS AND SLICERS

The Pharma Analytics Dashboard uses filters and slicers to allow users to interactively analyze the data. Users can select specific products, categories, regions, dates, or other available values to focus on the required information.

How to Use Slicers

- 1. Select the required value from the slicer.**
- 2. The report visuals will automatically update based on the selected value.**
- 3. Multiple values can be selected where applicable.**
- 4. Clear the selection to return to the overall report view.**

Purpose

Slicers and filters help users perform focused analysis and identify specific business trends without changing the underlying data.

BOOKMARKS

Bookmarks are used to save specific report views and visual states in the Power BI dashboard. In this project, bookmarks are used to provide different views of the Product Analysis page.

Available Bookmarks

- **Product Overview – Displays the overall product analysis view.**
- **Category View – Displays the selected category-level product analysis view.**

How to Use

Users can click the bookmark buttons to switch between the available report views. The bookmark restores the saved visual and filter state of the report page.

Purpose

Bookmarks improve dashboard navigation and allow users to switch between different analytical views without creating additional report pages.

CUSTOM TOOLTIP

A custom tooltip is used in the Pharma Analytics Dashboard to display additional information when the user hovers over a data point. A separate Product Tooltip page has been created to provide detailed product-level information.

Information Displayed

- Total Sales
- Total Quantity
- Total Profit

How to Use

Users can hover over the relevant product or data point in the report to view the custom tooltip. The tooltip displays additional information without requiring the user to navigate to another report page.

Purpose

Custom tooltips improve the user experience by providing additional insights in a compact and interactive way.

DRILL-THROUGH

Drill-through is used to navigate from a summary report page to a detailed report page based on a selected data point. In this project, the Product Name field is used as the drill-through field.

How to Use

1. Go to the Product Analysis page.
2. Right-click on the required product.
3. Select Drill-through.
4. Select Product Details.
5. The Product Details page displays detailed information for the selected product.
6. Use the Back button to return to the previous report page.

Purpose

Drill-through allows users to move from high-level product analysis to detailed product-level information without creating separate reports.

ROW LEVEL SECURITY(RLS)

Row-Level Security (RLS) is used to restrict data access based on the user's assigned region. In this project, RLS is implemented using the DIM_REGION[REGION_NAME] column.

Security Role

Role Name: Region Security

Filter: DIM_REGION[REGION_NAME] = "East"

How to Use / Test

1. Create the Region Security role in Power BI.
2. Apply the filter to DIM_REGION[REGION_NAME].
3. Use Modeling → View as to test the role.
4. When the role is applied, only the data associated with the East region is displayed.

Purpose

RLS improves data security by ensuring that users can view only the data permitted by their assigned security role.

WEB URL

The Web URL feature is used to provide clickable external links for specific products in the Pharma Analytics Dashboard. Different URLs are dynamically assigned to products using a DAX SWITCH function.

Available Web Links

- Paracetamol 500mg → YouTube
- Amoxicillin 500mg → Google
- Vitamin C 500mg → ChatGPT
- Cetirizine 10mg → WhatsApp Web

How to Use

1. Open the Web URL Analysis page.
2. Locate the required product.
3. Click the URL icon displayed in the table.
4. The corresponding web page will open.

Purpose

Web URLs provide quick access to external web resources directly from the Power BI report and improve report interactivity.

POWER BI SERVICE

The completed Pharma Analytics Dashboard is published to Power BI Service for online access and report sharing. Power BI Service allows users to view and interact with the published report through a web browser.

How to Use

- 1. Open Power BI Service.**
- 2. Navigate to the workspace where the report is published.**
- 3. Open the Pharma Analytics Dashboard report.**
- 4. Select the required report page.**
- 5. Use the available filters, slicers, bookmarks, drill-through, tooltips, and navigation buttons.**

Purpose

Power BI Service provides a centralized platform to access and interact with the published dashboard online.

DASHBOARD FEATURES SUMMARY

The Pharma Analytics Dashboard provides an interactive and user-friendly environment for pharmaceutical sales analysis. The major features implemented in the project include:

- **Executive Sales Overview**
- **Product Analysis**
- **Page Navigation**
- **Filters and Slicers**
- **Bookmarks**
- **Custom Tooltips**
- **Drill-through Analysis**
- **Row-Level Security (RLS)**
- **Dynamic Web URLs**
- **Power BI Service Publishing**

These features help users explore the data, analyze product and sales performance, navigate between report pages, and access detailed information securely.
